

Report
Of
GenAI Powered Data Analytics Job Simulation

Submitted

To

School of Computer Science and Engineering

IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of

B.Tech CSE

By

Roll Number of Student: 25scs1003000785

Name of Student: AKASH RAJ

1. CANDIDATE'S DECLARATION

I, Akash Raj, do hereby declare that the internship report titled "GenAI Powered Data Analytics Job Simulation" has been completed by me to fulfil the requirement for the award of the degree of Bachelor of Technology in Computer Science and Engineering. All the references have been quoted and I have not taken as such any material from any other source. I affirm that this report is my own work and has not been submitted to any other institute for any degree/diploma requirement, and I shall be solely responsible for any kind of copyright violation in this regard.

Signature:

A photograph of a handwritten signature in black ink on a light-colored surface. The signature is stylized and appears to read 'Akash Raj'.

Student Name: Rohinish singh

Roll No.: 25scs1003004961

2. ACKNOWLEDGEMENT

I am using this opportunity to express my gratitude to everyone who supported me throughout the Internship Program. I am thankful for their aspiring guidance, invaluable constructive criticism and friendly advice during this work. I am sincerely grateful to them for sharing their truthful and illuminating views on a number of issues related to this work.

I would also like to thank the Forage platform and the organization that designed the GenAI Powered Data Analytics Job Simulation, which gave me the opportunity to apply data analytics and AI-assisted thinking to a practical business scenario.

I express my gratitude to my parents for their blessings.

Student Name: Rohinish singh

Roll No.: 25scs1003004961

3. INTERNSHIP COMPLETION CERTIFICATE

The certificate below confirms successful completion of the GenAI Powered Data Analytics Job Simulation, issued via the Forage platform in September 2026.

Mr Rohinish singh

GenAI Powered Data Analytics Job Sim

Certificate of Completion

September 9th, 2026

Over the period of September 2026, Mr Rohinish singhhas completed practical tasks in:

Exploratory data analysis and risk profiling
Predicting delinquency with AI
Business report and data storytelling for collections strategy Implementing an AI-driven collections strategy

Enrolment Verification Code 6aa1a41472c3c371117c19a8 | User Verification Code 6a9d994792075b8d741ffba9 | Issued by Forage

4. PROJECT DESCRIPTION

4.1 Introduction

This report presents an account of the GenAI Powered Data Analytics Job Simulation, a practical, self-paced internship-style program completed on the Forage platform in September 2026. The simulation was designed to mirror real tasks performed by a data analyst working with AI-assisted tools, giving hands-on exposure to how data-driven, AI-supported analysis informs real business decision-making. Across four practical tasks, the program moved from raw data toward a decision-ready business recommendation, covering exploratory data analysis, risk profiling, AI-assisted prediction, business reporting and data storytelling, and the design of an AI-driven collections strategy.

4.2 Organization Profile

Forage hosts free, employer-designed job simulations that let students complete practical tasks modeled on real workplace projects, without needing prior job experience. Forage partners with real organizations to design short, practical simulations so that students can experience authentic workplace tasks before they graduate. The GenAI Powered Data Analytics Job Simulation used in this report was issued in partnership with an industry organization and focused on applying data analytics and AI-assisted thinking to a business problem in the collections/risk domain.

4.3 Problem Statement

Organizations that manage customer accounts need to identify, ahead of time, which accounts are likely to fall behind on payments (become delinquent), so that attention and resources can be prioritized effectively. The core problem addressed in this simulation was: given a business dataset of customer/account records, how can exploratory analysis, risk profiling and AI-assisted prediction be combined to move from raw data to a clear, decision-ready recommendation that supports a risk-based collections strategy.

4.4 Project Objectives

- Build comfort with Exploratory Data Analysis (EDA) — examining data to uncover patterns and trends.
- Understand Risk Profiling — assessing accounts/customers for potential risk levels.
- Apply AI-Powered Prediction to support predictive analysis of delinquency risk.
- Practice Business Insight Generation — converting analysis into actionable business insight.
- Develop Data Storytelling skills — communicating findings clearly to decision-makers.
- Understand AI-Driven Strategy — how AI supports a risk-based collections strategy.

4.5 Scope of the Project

The scope of the simulation was organized around four practical tasks: (1) Exploratory Data Analysis and Risk Profiling, (2) Predicting Delinquency with AI, (3) Business Report and Data Storytelling, and (4) Implementing an AI-Driven Collections Strategy. The work was limited to conceptual and applied analysis on a provided

business dataset; no specific proprietary model, algorithm, or accuracy figure is claimed in this report, as none is stated on the completion certificate.

4.6 Technologies and Tools Used

The simulation focused on analytical concepts, AI-assisted reasoning and business communication rather than a prescribed toolchain, and the completion certificate does not specify particular software or programming languages. In line with this, the report focuses on the underlying skills and techniques applied: exploratory data analysis, risk profiling, AI-assisted predictive analysis, business reporting, and data storytelling using standard chart types (bar charts, trend lines, and pie/share charts) to communicate insights.

4.7 System Architecture

The work followed a conceptual analytics pipeline used to move from raw data to business action:

- Data — structured account/customer records collected for analysis.
- Preprocessing — organizing and preparing the data for analysis.
- AI Analysis — applying AI-assisted analysis to detect early-warning signals.
- Prediction — generating AI-assisted predictions of delinquency risk.
- Business Action — translating predictions into prioritized, risk-based action.

This pipeline was extended in the final task into a strategy-level view: Analytics (patterns from account data) → AI Predictions (likely delinquency risk) → Prioritization (ranking accounts by risk level) → Business Strategy (focused collections action).

4.8 Methodology

Task 1 — Exploratory Data Analysis and Risk Profiling: The first task combined exploratory data analysis with risk profiling. EDA involved reviewing the structure of the dataset, spotting trends, checking for missing or unusual values, and identifying variables that mattered before deeper analysis began. Risk profiling then built on this by grouping customers or accounts based on their likelihood of risk, using the patterns identified in the data. This task involved examining the business dataset, forming observations, and framing early risk indicators as a foundation for the tasks that followed.

Task 2 — Predicting Delinquency with AI: Delinquency refers to an account or customer falling behind on an expected payment or obligation, and anticipating it early allows a business to act before the situation worsens. This task involved working through a data → preprocessing → AI analysis → prediction → business action pipeline on the provided dataset — organizing the data, analyzing it for early-warning signals, and interpreting AI-generated predictions of delinquency risk to flag accounts needing attention.

Task 3 — Business Report and Data Storytelling: Analysis only creates value once it reaches a decision-maker. This task involved structuring findings from the earlier analysis into a clear, business-ready narrative aimed at supporting the collections strategy decision, and pairing the narrative with appropriate visuals (bar charts for comparing risk categories, trend lines for showing change over time, and pie/share charts for showing proportional splits).

Task 4 — Implementing an AI-Driven Collections Strategy: The final task connected the earlier work by turning AI predictions into a practical, risk-based strategy for prioritizing collections activity — ranking accounts by risk level so that the business could focus effort where it was most likely to matter, rather than treating every account uniformly.

4.9 Expected Outcomes

Through the four tasks, the simulation was expected to, and did, build the following capabilities: exploratory data analysis, risk profiling, predictive analytics, applying AI for business analytics, data storytelling, business reporting, analytical thinking, and data-driven decision making.

Key reflections and takeaways from the internship include:

- Analytics applied to real problems — seeing how data analytics connects directly to a real business scenario, not just a classroom exercise.
- AI as a decision-support tool — understanding how AI predictions feed into, rather than replace, human business judgment.
- Turning data into action — learning to convert raw analysis into insights the business can act on.
- Communicating findings clearly — practicing how to explain analytical results so non-technical stakeholders can follow them.
- Responsible, data-driven strategy — recognizing the importance of grounding business strategy in evidence, applied responsibly.

Overall, this internship gave structured, hands-on exposure to how data analytics and AI work together to support real business decisions — from exploring data and profiling risk, to predicting outcomes and shaping strategy — and the GenAI Powered Data Analytics Job Simulation on the Forage platform was successfully completed in September 2026.

4.10 Certificate of Completion and Other Communication/Mail Proof

A copy of the certificate of completion issued for the GenAI Powered Data Analytics Job Simulation is attached in Chapter 3 (Internship Completion Certificate) of this report. No additional communication/mail proof was issued as part of this simulation beyond the certificate shown.
