Internship / Job Simulation Report

GenAI Powered Data Analytics Job Simulation

Presented by **Rohinish singh**

Platform: **Forage** Completed: **September 2026**

About the Internship

Forage hosts free, employer-designed **job simulations** that let students complete practical tasks modeled on real workplace projects — without needing prior job experience.

This specific simulation, the **GenAI Powered Data Analytics Job Simulation**, focused on applying data analytics and AI-assisted thinking to a business problem — moving from raw data to a decision-ready recommendation.

Across its four tasks, the program gave hands-on exposure to how **data-driven, AI-supported analysis** informs real business decision-making — the core of a modern data analyst's role.

Data

Structured records analyzed for patterns

AI

Predictive, AI-assisted analysis

Business

Insights turned into strategy

Internship Objectives

Exploratory Data Analysis

Learn to examine data to uncover patterns and trends

Risk Profiling

Assess accounts/customers for potential risk levels

AI-Powered Prediction

Apply AI to support predictive analysis

Business Insight Generation

Convert analysis into actionable business insight

Data Storytelling

Communicate findings clearly to decision-makers

AI-Driven Strategy

Understand how AI supports collections strategy

Exploratory Data Analysis & Risk Profiling

Conceptual explanation — general analytical practice

Exploratory Data Analysis (EDA) is the first step in understanding any dataset — reviewing its structure, spotting trends, checking for missing or unusual values, and identifying variables that matter before deeper analysis begins.

Risk Profiling builds on this by grouping customers or accounts based on their likelihood of risk, using patterns found in the data. This helps an organization understand where attention is most needed.

In this task, **I practiced applying this process to a business dataset** — examining the data, forming observations, and framing early risk indicators as a foundation for the tasks that followed.

Analytical Flow

Review Raw Data

Structure, fields, completeness

Spot Patterns

Trends, outliers, relationships

Profile Risk

Group accounts by risk signal

Predicting Delinquency with AI

Delinquency refers to an account or customer falling behind on an expected payment or obligation. Anticipating it early lets a business act before the situation worsens.

General workflow, explained conceptually. In the simulation, I worked through this pipeline on a provided dataset — organizing the data, analyzing it for early-warning signals, and interpreting AI-generated predictions of delinquency risk to flag accounts needing attention. No specific model, algorithm, or accuracy figure is claimed here, as none is stated on the certificate.

Business Report & Data Storytelling

Analysis only creates value once it reaches a decision-maker. A **business report** translates technical findings into clear language, framed around what the business should do next.

Data storytelling pairs numbers with narrative — using the right visual for the right message so decision-makers can grasp insights quickly, without needing to interpret raw data themselves.

In this task, I practiced structuring findings from the earlier analysis into a **clear, business-ready narrative** aimed at supporting the collections strategy decision.

Illustrative chart types only — no dataset results are shown or claimed.

Compare risk categories

Trend Line

Show change over time

Pie / Share

Show proportional split

Implementing an AI-Driven Collections Strategy

The final task connected everything: turning AI predictions into a **practical, risk-based strategy** for prioritizing collections activity.

AI predictions allow accounts to be **prioritized by risk** rather than treated uniformly — so the business focuses effort where it is most likely to matter, connecting analytics directly to practical decision-making.

Skills & Tools Learned

Exploratory Data Analysis

Risk Profiling

Predictive Analytics

AI for Business Analytics

Data Storytelling

Business Reporting

Analytical Thinking

Data-Driven Decision Making

Key Learnings & Takeaways

Analytics applied to real problems

Saw how data analytics connects directly to a real business scenario, not just a classroom exercise.

AI as a decision-support tool

Understood how AI predictions feed into — rather than replace — human business judgment.

Turning data into action

Learned to convert raw analysis into insights the business can actually act on.

Communicating findings clearly

Practiced explaining analytical results in a way non-technical stakeholders can follow.

Responsible, data-driven strategy

Recognized the importance of grounding business strategy in evidence, applied responsibly.

CONCLUSION

A Practical Step into Data-Driven AI Analytics

This internship gave me structured, hands-on exposure to how data analytics and AI work together to support real business decisions — from exploring data and profiling risk, to predicting outcomes and shaping strategy.

Successfully completed the Forage GenAI Powered
Data Analytics Job Simulation — September 2026
